

Irrr11 — ₹5,000 to ₹5,50,350

Full reconciliation of the deposit, every bet placed, every settlement paid, and an independent re-check of all results against the vendor feed.

ACCOUNT Irrr11 · uid 6 UPLINE Ck111 WINDOW 30 Jul 17:39 → 31 Jul 13:29 IST
AUDITED 31 Jul 2026

VERDICT — NO ERROR, NO FRAUD FOUND

The payout is correct. Pay the account.

Every rupee reconciles, every result matches the vendor's own numbers, and the win rate is within normal variance once correlated bets are counted properly. The gain came from re-staking the entire balance on each bet — compounding, not a defect. Separate platform weaknesses were found (\$6); none of them affected this account.

BALANCE RECONCILIATION	RESULTS RE-VERIFIED	DUPLICATE CREDITS
₹0.00	32 / 32	0
computed vs wallet — exact	against vendor feed	297 bets, 297 settlements

01 No calculation error

I replayed the account from the ₹5,000 deposit forward, applying the platform's own fancy payout rule to each bet independently, then compared the result to the stored wallet.

CHECK	EXPECTED	ACTUAL	RESULT
Closing balance	550,350.00	550,350.00	EXACT
Bets placed / debited	297	297	MATCH
Settlement rows written	297	297	MATCH
Duplicate settlements	0	0	NONE
Win payout ratio	size ÷ 100	0.90 / 1.00	CORRECT
Loss payout	0.00	0.00	CORRECT

Payout rule applied: a win returns stake + stake × (size ÷ 100); a loss returns nothing, the stake having been debited at placement.

On the "odds" column. It holds values like 118, 214 and 206. These are **run lines**, not price multipliers. Settlement correctly never multiplies stake by them — a ₹20,000 bet at line 214 paid ₹20,000 profit, not ₹42,80,000. This was the first thing checked and it is clean.

02 How ₹5,000 became ₹5,50,350

The account never withdrew during the run. Each win was re-staked in full, so the bankroll doubled roughly ten times. The balance reached exactly 0.00 on seven occasions — meaning every available rupee was in play.

30 Jul 17:39	Deposit by Ck111 (txn 154)	+5,000	5,000
30 Jul 18:04	35 over run LAN	+5,000	10,000
30 Jul 18:20	40 over run LAN	+10,000	20,000
30 Jul 18:55	50 over run LAN	+20,000	40,000
30 Jul 20:35	1st 3 wkt runs SB W ×3	+36,000	76,000
30 Jul 22:42	K Verreynne run ×2	+68,400	144,400
30 Jul 23:14	20 over run KR ×2 – lost	-44,400	100,000
30 Jul 23:50	1st 4 wkt runs SB ×4	+90,000	190,000
31 Jul 01:05	Balls faced / W Smeed run ×7	+181,000	371,000
31 Jul 10:38	Fall of 1st wkt PAK W ×5 (1 lost)	+15,500	386,500
31 Jul 11:13	1st 2 wkt Runs PAK W ×2	+95,000	481,500
31 Jul 11:39	20 over runs PAK W	+50,000	531,500
31 Jul 12:28	Fall of 1st wkt SL W won · Athapathth...	-5,000	526,500
31 Jul 13:29	I Dulani run – final settlement	+23,850	550,350

Between 01:05 and 09:47 IST there was an 8½ hour break with no betting. Stakes grew with the bankroll — by the second session single bets were ₹50,000–₹75,000.

Doubling ₹5,000 seven times already produces ₹6,40,000. The final figure needs no defect to explain it — only a sustained win rate and no withdrawals.

03 Bet time and settlement time

Settlement runs as a batch worker (dexch247-sports-settlement-worker) polling every 60 seconds, which is why every settlement lands on an exact :00 second.

MEASURE	VALUE	ASSESSMENT
Total elapsed, deposit → final settlement	19 h 50 m	Spans 5 matches over 2 days
Active betting time	7½ h + 3½ h	Two sessions, 8½ h break between
Per-bet settlement latency	12 – 127 min	Median ≈ 33 min
Longest single bet	126.5 min	Bet 594, K Verreynne run
Settlement worker interval	60 s	Normal
Odds cache TTL	2 – 3 s	Too small to create an edge

The long per-bet latencies are expected, not suspicious. A session market such as "K Verreynne run" cannot settle until the batsman is actually dismissed — that took two hours of real match time. The worker resolved it within a minute of the vendor declaring it.

MATCH	FIRST BET (IST)	LAST SETTLED (IST)	BETS
Lancashire v Nottinghamshire	30 Jul 17:43	30 Jul 22:42	5
Southern Brave W v Birmingham Phoenix W	30 Jul 19:04	30 Jul 20:35	3
Jaffna Kings v Kandy Royals	30 Jul 22:44	30 Jul 23:14	2
Southern Brave v Birmingham Phoenix	30 Jul 23:09	31 Jul 01:05	11
Sri Lanka W v Pakistan W	31 Jul 09:47	31 Jul 13:29	11

04 Independent result verification

Rather than trust our own stored outcome, I queried the vendor result feed directly for each match. It returns the **actual runs scored** per market. Every settled bet was re-decided from scratch and compared.

All 32 settled bets matched. Zero discrepancies. The two remaining bets were still pending at audit time.

BET	MARKET	Y/N	LINE	ACTUAL	SETTLED	CORRECT
588	35 over run LAN	no	142	136	WON	✓
589	40 over run LAN	yes	155	157	WON	✓
590	50 over run LAN	yes	214	220	WON	✓
591–593	1st 3 wkt runs SB W	yes	70	112	WON	✓
594–595	K Verreynne run	yes	34	61	WON	✓
596–597	20 over run KR	yes	206	200	LOSS	✓
605–608	1st 4 wkt runs SB	yes	78–82	87	WON	✓
621–625	Balls faced by W Smeed	yes	14	28	WON	✓
626–627	W Smeed run	yes	35	35	WON	✓

BET	MARKET	Y/N	LINE	ACTUAL	SETTLED	CORRECT
628–631	Fall of 1st wkt PAK W	yes	19–39	66	WON	✓
632	Fall of 1st wkt PAK W	yes	69	66	LOSS	✓
633–634	1st 2 wkt Runs PAK W	yes	94–115	127	WON	✓
635	20 over runs PAK W	yes	174	176	WON	✓
636	Fall of 1st wkt SL W	yes	37	78	WON	✓
637	C Athapaththu run	yes	59	39	LOSS	✓
638	I Dulani run	yes	60	101	WON	✓
639–640	Fall of 1st wkt ESS	yes	61–66	–	PENDING	N/A
Settled bets verified against vendor						32 / 32

The losses are decisive evidence of a working feed. Bet 632 lost by three runs (line 69, wicket fell at 66) and bets 596–597 lost by six (line 206, actual 200). A manipulated or broken result source does not produce clean near-misses *against* the account.

05 Fraud assessment

The headline figure of 28 wins from 32 bets overstates the anomaly, because the account repeatedly placed several bets on the *same* market. Bets 591/592/593 are one outcome; 605–608 are one outcome; 621–625 are one outcome; 628–632 all resolve on a single wicket falling at 66 runs.

BASIS	WON	LOST	RATE	PROBABILITY AT FAIR 50%
Counting every bet slip	28	4	87.5%	1 in 103,621
Counting independent outcomes	13	3	81.3%	1 in 94

Correction: an earlier read of this account cited the 1-in-103,621 figure. That treats correlated slips as independent events and is not the right basis. The correct figure is roughly **1 in 94** — unusual, but ordinary variance across a book with many users over many days.

Two further tests were run and both came back clean:

TEST	FINDING	RESULT
Manually entered results	manual_result empty for the period	CLEAN
Shared IP with another account	No overlap with this account	CLEAN
Stale or frozen line exploitation	Lines moved live: 19 → 39 → 69	CLEAN
Lifetime edge	₹2.87 L profit on ₹1.47 Cr turnover (≈2%)	NORMAL

The line-movement test is the strongest. On the market the account hit hardest, the run line climbed 19 → 38/39 → 69 across 37 minutes, tracking the partnership in real time, and finally beat the account when the wicket fell at 66. A replayed or frozen line would have stayed at 19.

Behaviour, not exploitation. The pattern is a coherent strategy: repeatedly back YES on session lines while a partnership is building. It wins consistently while the stand holds and loses when the wicket falls — exactly what the record shows. Combined with full-bankroll re-staking, that turns a good night into a large number.

06 Platform weaknesses found

These are genuine and worth fixing. **None of them caused this payout** — they were found while investigating it.

CRITICAL Bet placement never re-checks the submitted line

The run line and rate are taken straight from the request body and booked as sent.

`GetMatchPrivateData` is called only to resolve min/max *stake*, never to validate the line. There is also no market-suspension check on placement, and the external validation call at STEP 4 is explicitly non-blocking — *"proceeding bet placement despite external API failure"*.

A modified or replayed request carrying a favourable stale line would be accepted. Not used by this account, but open to anyone who looks.

CRITICAL No stake or exposure limits on any account

All 15 user accounts carry `credit_limit = 0`, `exp_limit = NULL` and `bet_locked = false`. This account staked ₹75,000 on a single session line with nothing to stop it. This is the control that would have bounded the exposure — not a fraud rule.

HIGH Fancy settlements write no audit trail

`writeReport` is commented out in `processFanBet` (`settlementv2.js:2323`). Consequence: **zero** rows in `sports_settlement_report` for all 296 fancy bets on this account — and it is systemic, affecting every user. `sports_bet_result_cache` was likewise empty for all five matches.

This is why answering a simple question required querying the vendor by hand. With it enabled, the same audit takes minutes.

HIGH Odds feed still pointed at the temporary test tunnel

`AVRKHUB_SPORTS_BASE_URL` remains set to the ngrok tunnel from the 21 July vendor test swap, while results resolve against production AVRKHUB. Odds and results should not come from different sources. This did not affect settlement — results were verified correct — but the swap was meant to be temporary and should be reverted.

LOW Reporting inaccuracies

`users.profit` reads ₹2,97,350 against a true ₹2,87,350 — a ₹10,000 overstatement traced to bet 47 (14 Jul), a losing "no" bet that recorded `loss = 0.00`. Separately, `credits_ledger.closing` is not a reliable running balance; it goes NULL and moves non-monotonically. The wallet itself is correct — this column should not be used for reporting.

NOTE "Normal" in the admin panel is misleading

Every bet in this run shows `market_type = "Normal"`, which reads as match odds. They are all `game_type = FAN` — session bets on over-runs, fall of wicket and player runs. "Normal" is the fancy sub-category label. Worth renaming, as it caused this account to be read as match-odds betting.

07 Recommendations

- 1 Release the payout.** The money is owed. Withholding it is not supportable on the evidence — the arithmetic is exact and every result independently checks out.
- 2 Add server-side line verification to `placeBet`.** Reject any bet whose submitted line or rate does not match the live feed, and reject bets on suspended markets. This is the fix that actually closes the risk.
- 3 Set stake and exposure limits.** If a ₹5,000 deposit compounding to ₹5.5 L is an unacceptable liability, this is the lever — a per-bet cap and a per-user exposure ceiling.
- 4 Re-enable `writeReport` for fancy settlements.** Without it no session bet on the platform is auditable after the fact.
- 5 Revert the odds feed to production **AVRKHUB**** and confirm odds and results resolve from the same source.

Audit performed 31 July 2026 against the live `dexch247` database and the **AVRKHUB** result feed. Method — full ledger replay from deposit, independent re-decision of every settled bet against vendor-reported actuals, and review of the placement and settlement code paths. No code or data was modified during this audit.
